Who we are

Composite materials are fantastic materials to design with because they can be optimised to deal efficiently with the environmental and structural conditions they are exposed to. Perhaps more importantly, they allow for freedom of shape in whatever applications in which they are used.

For anything other than a flat shape, a mould is always required. For one-offs and low series production this can lead to an incredible amount of waste once the product has been made.

We have a vision to eliminate the waste from tooling.
